 Work Requests21

Technical specification

ManWinWin is a *standard* maintenance management software which reaches, with great detail, coding and recording of the maintenance items, planning and managing maintenance works, quantification of the man-hour, materials and contracted services, effort and costs, managing stock item stores and resulting key performance indicators.

One software, 3 designations:

ManWinWin is an integrated and single solution which presents itself commercially under 3 designations which are different, essentially, in its initial default configuration.

Industrial Maintenance

The flexible, modular and integrated solution for industrial maintenance management

Building Maintenance

The easy to implement system for building maintenance management

Fleet Maintenance

A simple to use product for vehicle fleet maintenance management

Software Modules – Integrated Solution

Maintenance

System's main module which includes the **Plant** – detailed coding of equipment/maintenance items – the **Work Orders** – Work Order management – the **Materials** – listing all materials relevant for maintenance – the **Costs** – maintenance costs details – and the performance analysis and **key performance indicators**.

Materials

Maintenance stock items recording with resources for multiple stores centralized management and constant inventory.

Requests

Peripheral module (but linked to the same database), working outside of the main interface, used exclusively to create and manage maintenance work requests.

Web resources

100% web based resources for creating and following up maintenance work requests.

Software technical features

- ✎ Developed in the most recent Microsoft .NET and Microsoft SQL Server technologies.
- ✎ Printing or exporting all the information from the application using reports from Crystal Reports.
- ✎ Multi-user platform.
- ✎ Integrated maintenance work request module, without user access limit, with Web platform.
- ✎ Allows remote operation under the concept of *Remote Application*.
- ✎ User interface and form design in line with the typical practices for Microsoft solutions.

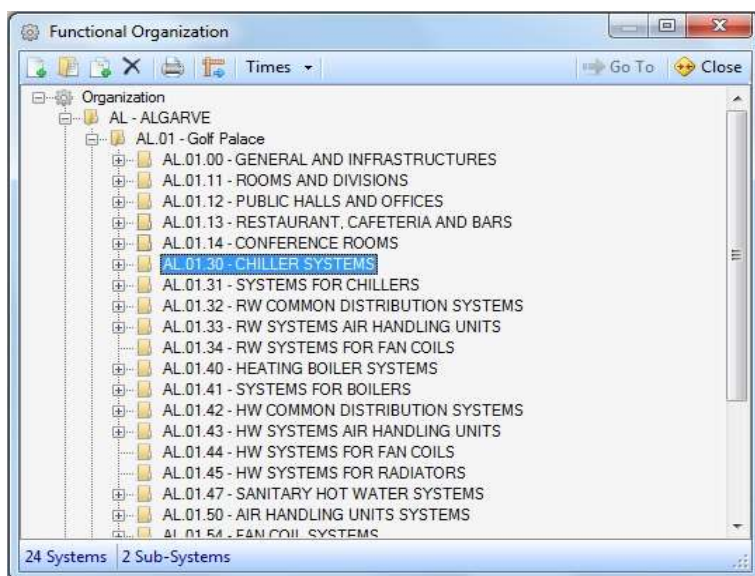

Main features detailed view

The software is supplied with a pre-configured data base according with what you need to manage: Buildings, Vehicle fleets or Industrial facilities.

The system has a modern and intuitive interface with the purpose of making tasks of data creation and update easier and faster. Some of the application's cross-cutting features are:

- ✎ Data search filter with *wild cards* feature. Ex: "Comp%" will return all records beginning with "comp".
- ✎ Tree structures. Insert a new record placing the cursor on the record directly above.
- ✎ Button and label together. Popup windows are called directly from the field label, which is also a button.
- ✎ Mandatory fields marked in red; in blue the ones we strongly recommend filling.
- ✎ Printing features allow always a preview and export of the reports to other more common file extensions.

System main configurations

Functional Organization

As its name suggests, functional organization consists in specifying the function or system for a group of items in the context of an installation. Grouping all the equipment that contributes to a determined function implies that a failure, in any of them, may affect that function global performance. The functional organization expresses the engineering point of view of the installation. InnWinWin is supplied with a complete functional organization for buildings, AutoWinWin with one for vehicle fleets and ManWinWin with another for industry.

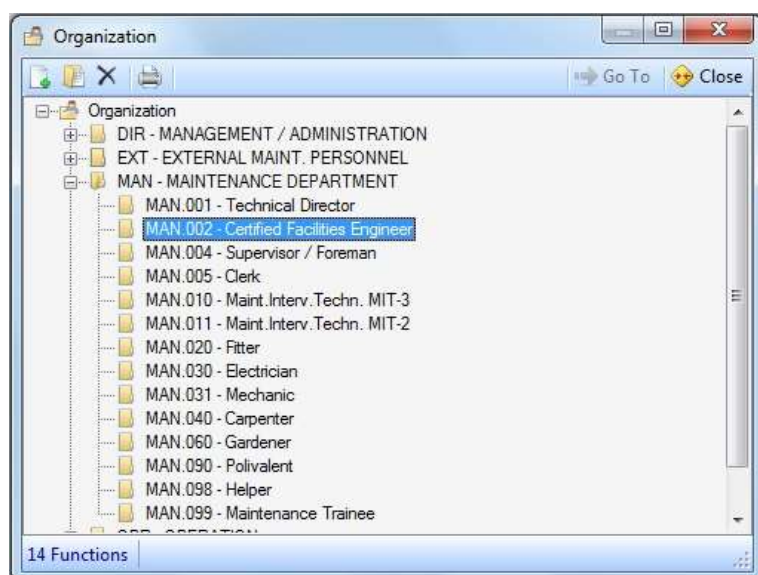

Cost Centers

Expresses the installation from the company's financial department point of view, that is, the same maintenance information but more synthetic and convenient for the financial management. Typically each building can be considered has one Cost Center that can be unfold into multiple sub Cost Centers.

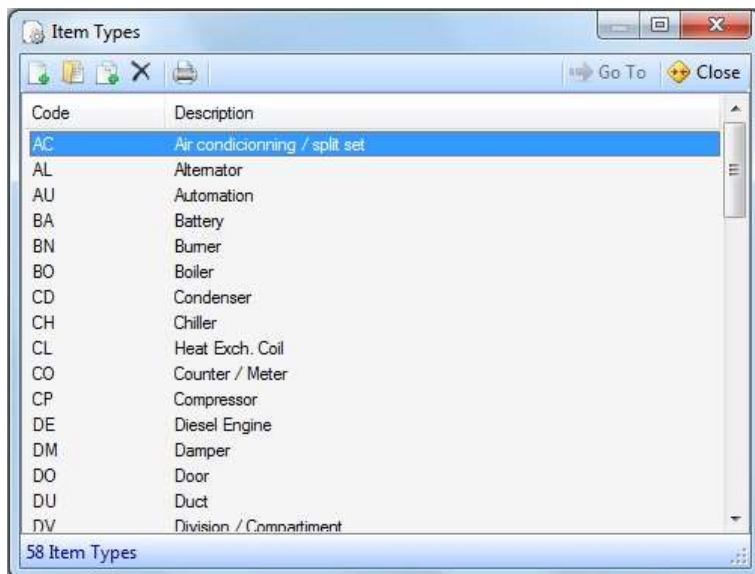

Suppliers

Amongst the most relevant maintenance suppliers we find the maintenance services suppliers, equipment suppliers or manufacturers and the maintenance parts and materials suppliers.

Technical intervention area

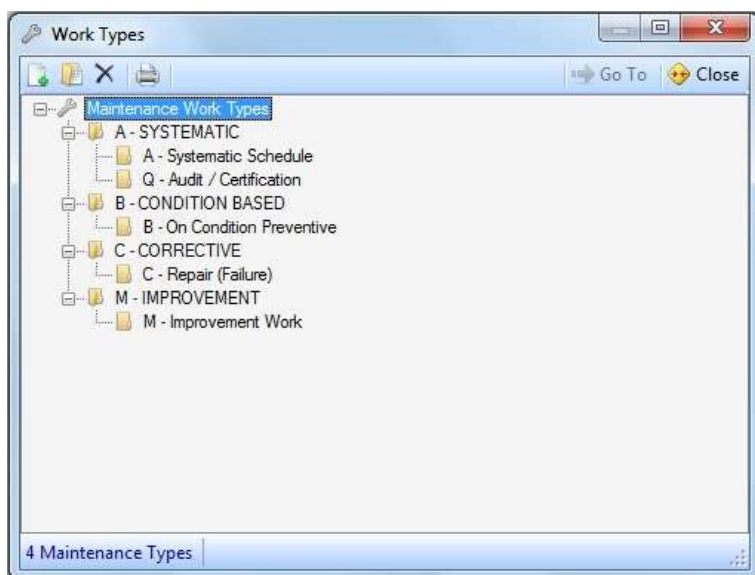

Represents the company's internal structures with intervention in maintenance. The structure is shown in an organization chart, where every position is hierarchically specified, and it should be able to fit all personnel with intervention in maintenance. The ones with the most direct intervention will be included in the maintenance department, with one or more workshops, and separated by their expertise, like mechanical, electrical, etc. For every expertise a Man Hour cost will be established, this will express the average cost for the maintenance work human resources direct mobilization.

Maintenance item types

The item type is a configuration which will allow a consistent coding for any maintenance item. Similarly, and with more or less suggestive groups of letters, we can establish, for instance, AL=Alternator, BA=Battery, CH=Chiller, etc.

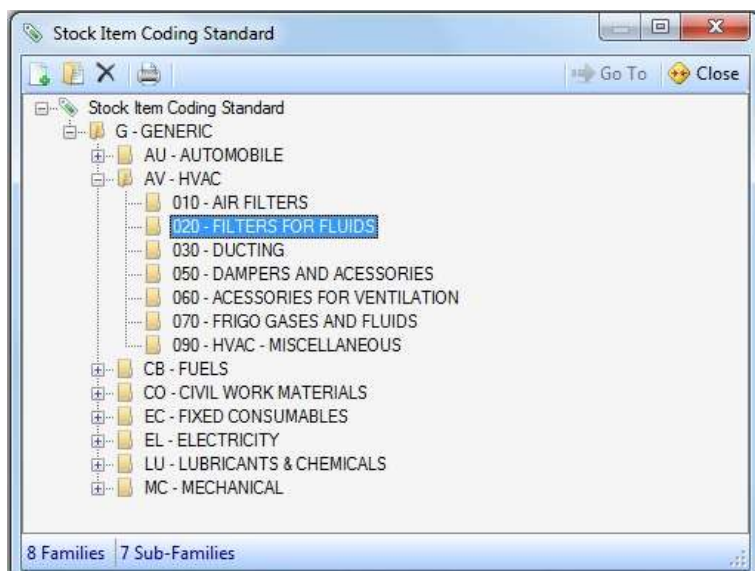

For every item type there will be a particular data sheet associated (maximum of 40 for each item type) for the purpose of gathering the necessary information to manage the item's maintenance.

Work types

It is important to have some way to classify the different work types while managing maintenance in order to give an idea of what is the amount of effort and cost for each of these types. With this information, the manager should be able, if necessary, to change his maintenance strategy in order to optimize his management results. Maintenance tasks can be grouped in the following 3 main types, which afterwards can be unfold into several sub types:

- Systematic preventive maintenance (routine inspections, calibrations, lubrications)
- Condition based preventive maintenance (on condition preventive, improvement)
- Corrective maintenance (repair)

Stock item coding standard

The systematized organization of Classes, Families and Sub Families expresses the stock item coding standard. The purpose is to have a reasonable number of items inside every group, through the logical structure generated by grouping Class + Family + Sub Family, and still keeping them easy to find.

Example: G=Generic Class, AV=HVAC Family, 020=Filters for fluids Sub Family, 023=Item sequential number.

A screenshot of the 'Users Administration' window. The window has a title bar with standard Windows controls. Below the title bar is a search bar and a 'Clean Filter' button. The main area contains a table with four columns: 'Code', 'Name', 'Position', and 'Entity'. The table lists several users, including 'David Scott', 'DEMO User', 'Hugo Borges', 'James Bond', 'John Stevenson', 'Nuno Castro', and 'William Goldfinger'. The 'Entity' column shows '01.0248 - Golf Palace' for some users. At the bottom left of the window, it says '7 Users'.

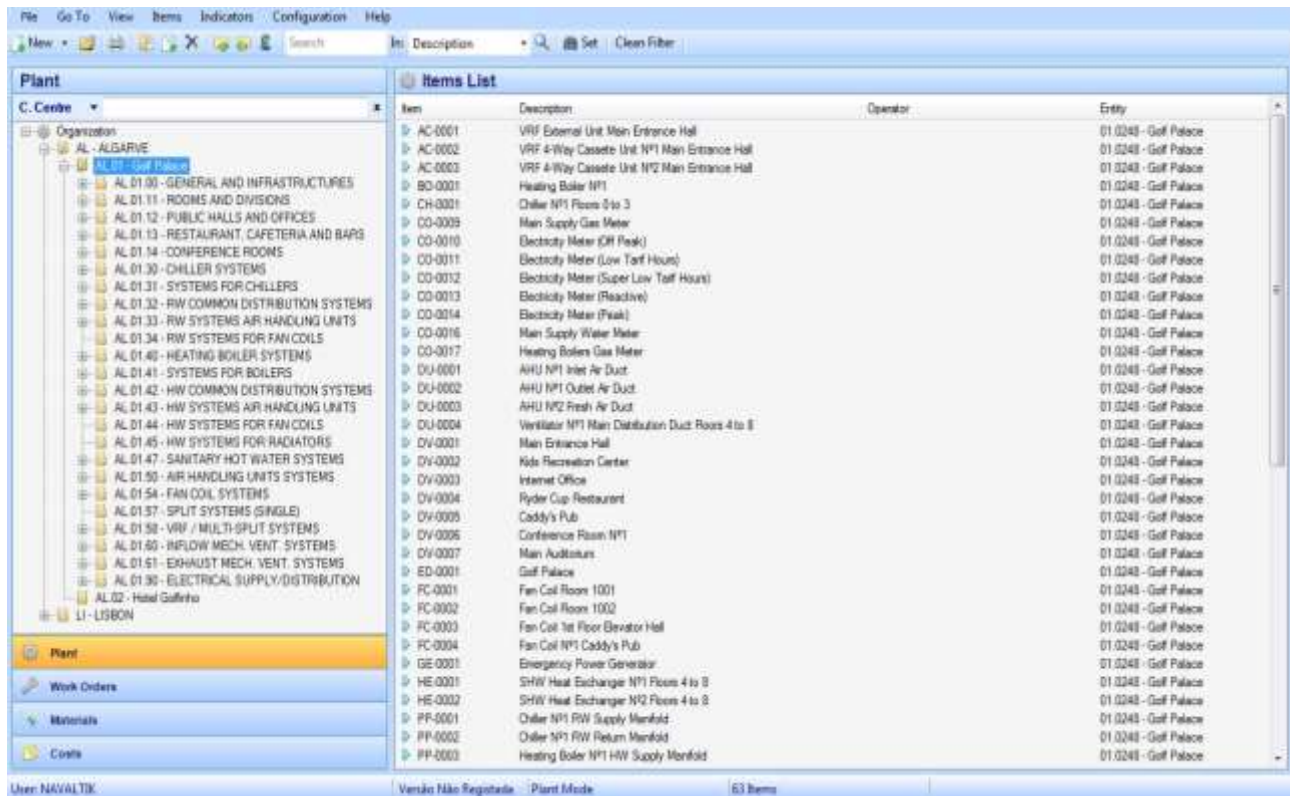

| Code | Name | Position | Entity |
|-------|--------------------|---------------------------|-----------------------|
| 09001 | David Scott | EXT.018 - External MNT. 2 | |
| DEMO | DEMO User | EXT.002 - External CFM | |
| 09152 | Hugo Borges | MAN.090 - Polivalent | |
| 09142 | James Bond | MAN.031 - Mechanic | 01.0248 - Golf Palace |
| 09072 | John Stevenson | DIR.010 - Director | |
| NC | Nuno Castro | DIR.015 - Assistant | |
| 09143 | William Goldfinger | MAN.090 - Polivalent | 01.0248 - Golf Palace |

User Administration

System users have to be necessarily recorded as employees. The system users chart and the company employees chart is the same. There is also the possibility of setting up a password and detailed access levels for each user.

Equipment plant – Item coding and detailed recording

Recording a maintenance item involves always coding and coordinating it in a cost center and in the functional organization. If the item is a *management item*, this means always planning the item's preventive maintenance and work order scheduling.

The items are shown in a chart, according to a user defined filter, with full access to available features for one individual item or for the all set of items from this chart.

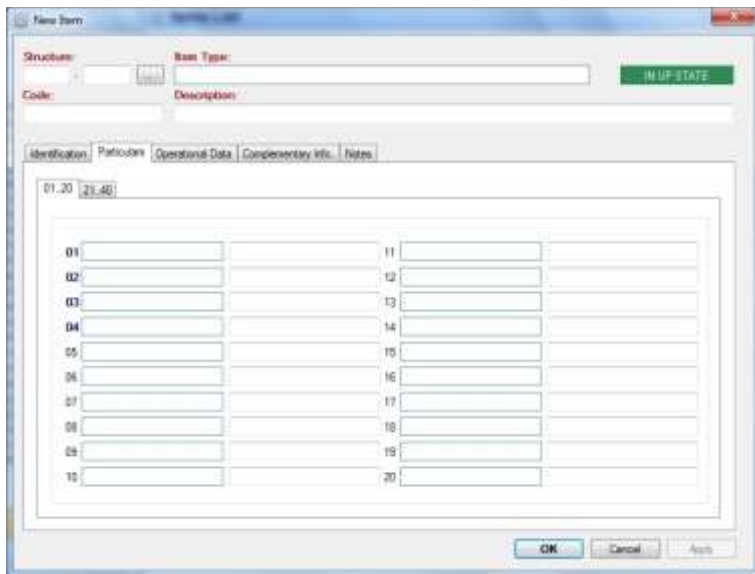

New Item – Identification

The item code is based on the item type + a sequential number.

Mandatory fields: functional organization and cost center coordination.

Picture (jpg, gif, bmp, etc.)

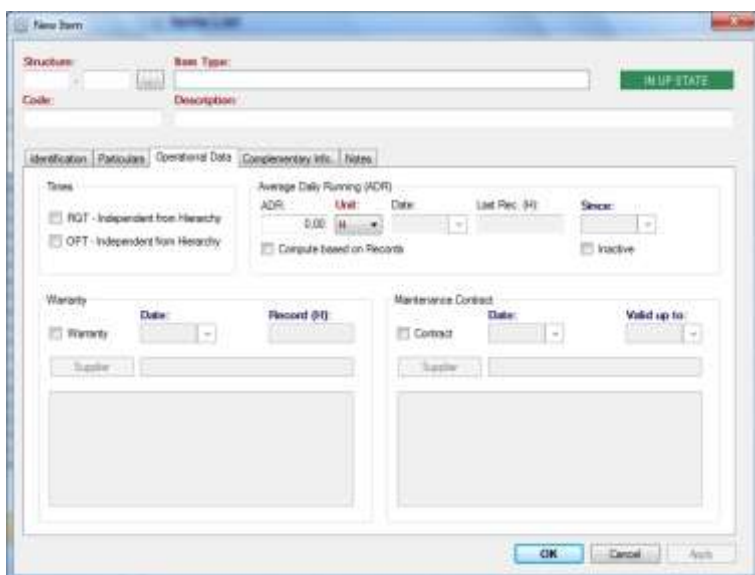

Document association (i.e. drawing, particulars chart, user manual, etc.)

New Item - Particulars

Particulars data sheet (maximum of 40 for each item type)

The particulars data sheet is defined by the user for each item type.

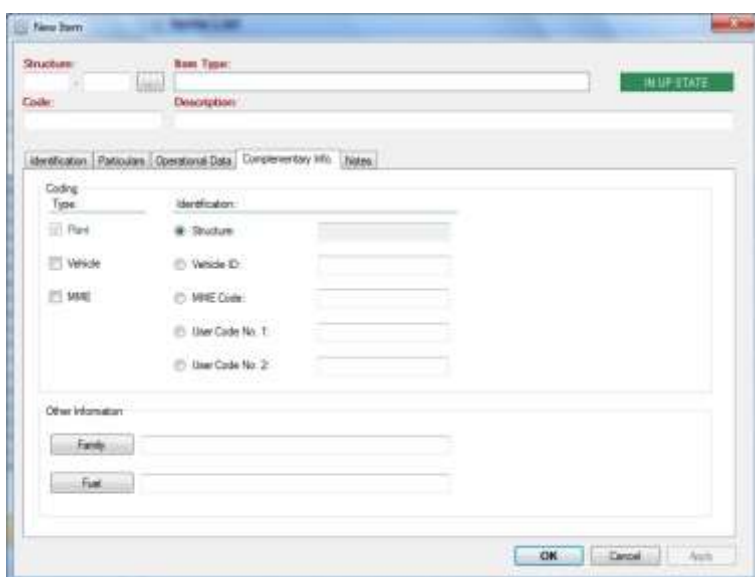

New Item – Operational data

Required and operating times for performance indicators calculation.

Possibility of average daily running time automatic calculation based on running records.

Possibility of searching for items with warranty and maintenance contract.

New Item – Complementary information

Possibility of assigning alternative codification for the item and choosing the code by which the item is managed across the application.

Additional information for MME, which require calibration, and vehicles.

Plus a free text field reserved for notes.

Maintenance Schedule

Item: BO-0001 - HEATING BOILER UNIT

Work Type: A - SYSTEMATIC SCHEDULE

Code: A-02

Description: Overhaul Inspection 12M

Plan TM (H): 6.00

Periodicity: Calendar: 12 Months

Records (H):

Next MSch: A-02

Library: BO-0002 - BOILER OVERHAUL INSPECTION 12M

Keep Connection Library

Tasks: Man Hours | Stock Items | Other | Documents

SAFETY PRECAUTIONS

- Before intervening on the equipment ensure that the electrical supply is duly switched off and cannot be inadvertently put on. Equipment at ambient temperature.

CAUTION

- These instructions are for guidance only. You should obtain the manufacturer's manual and adjust accordingly.

TASKS

- Further to the 1M routine inspection tasks, put the equipment off service observing above precautions and carry out the following:
- Check and adjust the water level control
- Calculate the boiler efficiency
- Visually check the boiler unit
- Check condition of refractories
- Check for leakage in joints on the flue gases side and on the water side
- Clean thoroughly the gases section

OK Cancel Apply

Maintenance Schedule

Each maintenance item will have a maintenance plan.

Systematic tasks based on calendar time (hotel rooms typical case, certification renewals and audits, etc.), running records (compressors, etc.) or a combination of both (emergency generator).

Each maintenance schedule consists of safety precautions description, tasks and estimates for duration, man effort, materials and third party services, which represent the work cost estimate.

Applied Stock Items

Item: BO-0001 - HEATING BOILER UNIT

| Item | Code | Description | Place | Qty | Unit |
|---------|---------------|-------------|-------|------|------|
| BO-0001 | 02.04.001.002 | Flue Gas | | 1.00 | 100 |

1 Stock Items

Applied stock items

Applicable spares or incorporated components list. This is a comprehensive relationship between stock and maintenance items. The opposite relationship may also be tracked, you can find out in which maintenance items a particular stock item is applied.

Running Record

Item: CO-0010 - ELECTRICITY METER (OFF PEAK)

| Item | Date | Record | Unit | Operator |
|---------|------------------|-----------|------|----------|
| CO-0010 | 29-07-2011 10:00 | 6.591.862 | KWH | 09152 |
| CO-0010 | 31-08-2011 10:00 | 6.706.258 | KWH | 09152 |
| CO-0010 | 30-09-2011 10:00 | 6.822.901 | KWH | 09152 |
| CO-0010 | 31-10-2011 10:00 | 6.933.019 | KWH | 09152 |
| CO-0010 | 30-11-2011 10:00 | 7.017.318 | KWH | 09152 |
| CO-0010 | 30-12-2011 10:00 | 7.096.325 | KWH | 09152 |
| CO-0010 | 31-01-2012 10:00 | 7.179.429 | KWH | 09152 |
| CO-0010 | 29-02-2012 10:00 | 7.242.062 | KWH | 09152 |
| CO-0010 | 30-03-2012 10:00 | 7.313.384 | KWH | 09152 |
| CO-0010 | 30-04-2012 10:00 | 7.387.489 | KWH | 09152 |

Date Last Rec.: 30-04-2012

Last Record: 7.387.489 KWH

ADR-R: 2497.88 KWH/H

Projections

On Date: []

Shall have: [] KWH

Shall attain: [] KWH

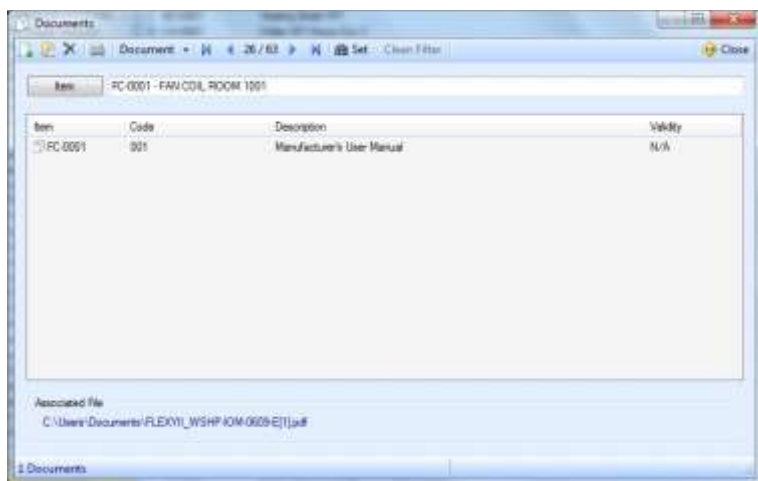

On Date: []

10 Records

Running records / Meter readings

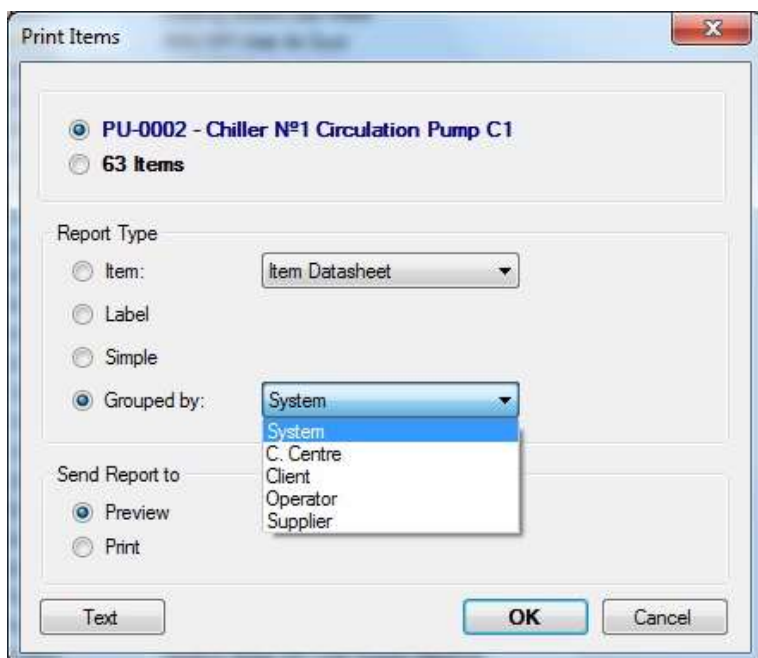

Capable of calculating projections like: "how many operating hours will the item have in a certain date?", and also "which will be the electricity meter reading at the end of the year?"

Different data printing templates.

Attached documents

It is possible to attach any type of document with a maintenance item. Optionally, this association allows you to define an end date to the document. The document link will be available for all the users.

Printing maintenance items

The software has several maintenance item report types

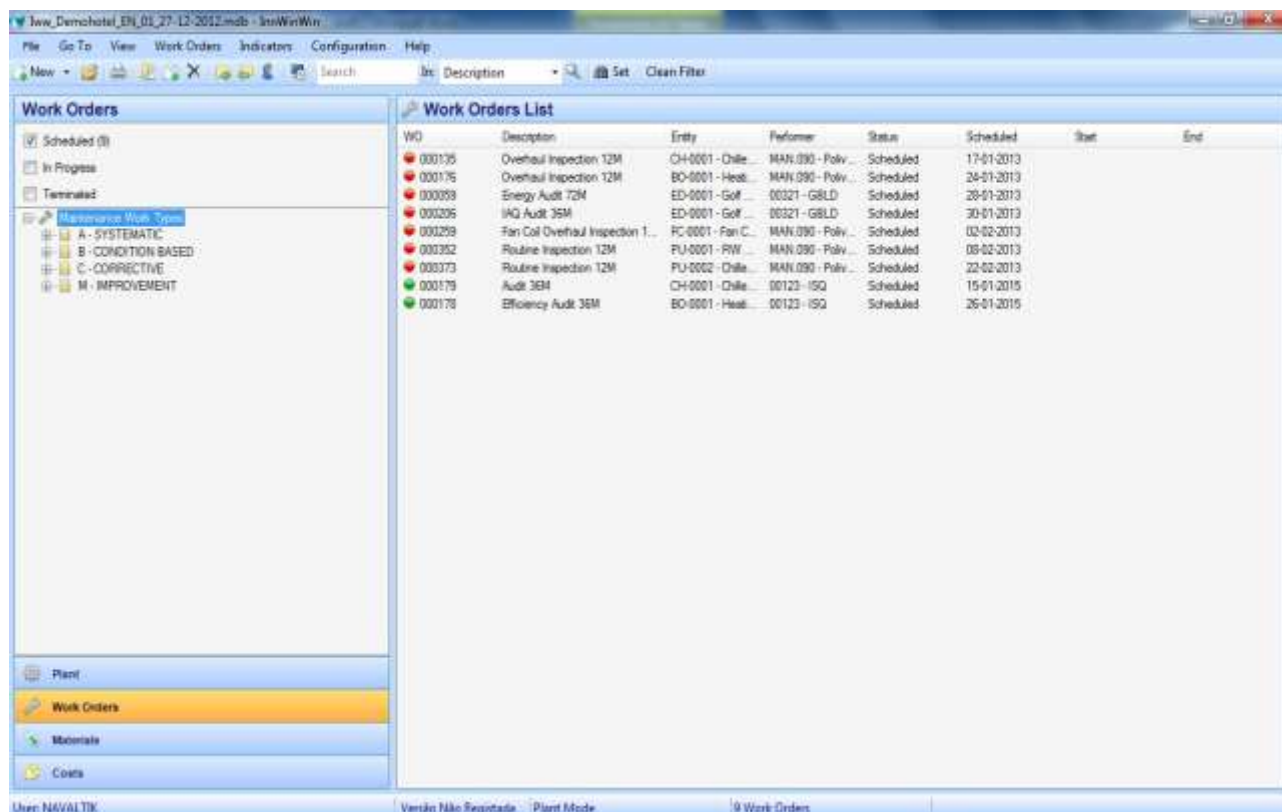

The reports refer to the selected item or to the entire item list and may also be grouped in many ways.

Other features from the Equipment Plant

- Maintenance items copying («Repeat») along with their maintenance plans and applied stock items. This feature eases and speeds up system information initial recording.
- Several maintenance items searching filters with the possibility of getting different report types for that group of items.
- Maintenance plan for a group of items along with the projection of future interventions and their estimated costs.
- Running records with or without fuel supply in which the parameter “RR – Running Record” is based on. It allows, for instance, knowing in detail the energy consumptions from an energy meter or the travelled distance of a vehicle.
- Down time records. The system allows automatic recording down time from work orders or manual recording down time directly in the maintenance item.
- The system generates real-time analysis for all maintenance parameters based on different events (costs, failures, times, etc.). These analysis can be calculated for the present year, for the last 12 months or for the last 5 years.

Maintenance Work – Work Order Management

Managing maintenance works is Maintenance's basic function. Every intervention involving resource consumption – Man Hours, Materials or Third Party Services – is recorded in the system in the form of a work order.

The software has a notification (alert) system based on traffic lights which is dynamically updated according to the due date.

The work periodicity can be defined based on calendar time or in any running record set for the item (Km's, hours, cycles, etc.).

Work Order Statuses

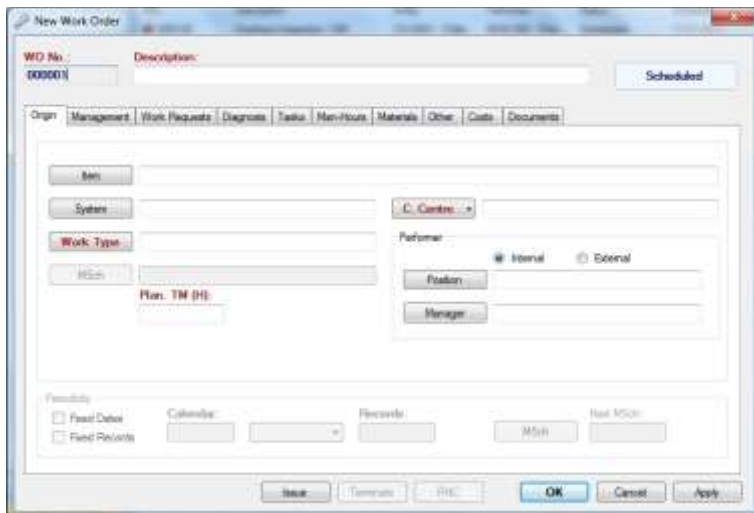

Every time a systematic work order is created in the system, the next one will only be created when the last one is ended («*Terminated*»).

For this to happen it is necessary for the user to change the work order status manually. Work orders allways run through the following statuses:

Scheduled – Scheduled work with a certain date of execution;

In Progress – Issued work; until its completion, management of this work belongs to the responsible entity or technician from the technical intervention department;

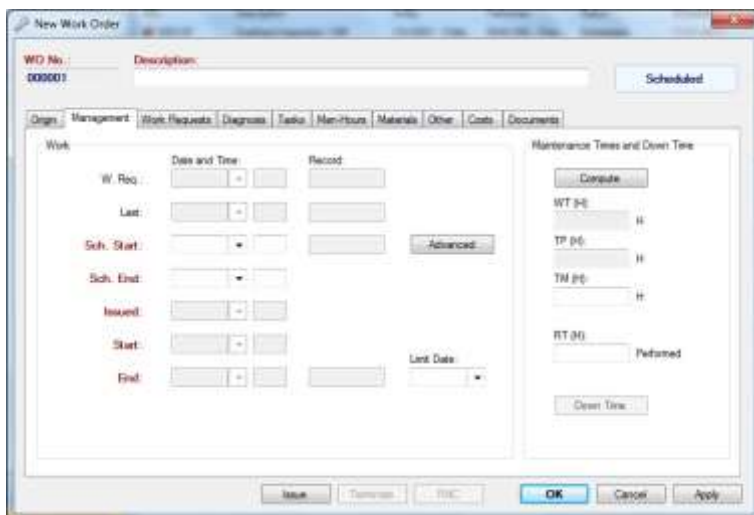

Terminated – Although it refers to a terminated (ended) work, records or any other information can still be recorded in the work order.

The 'New Work Order - Origin' window shows a form for creating a new work order. It includes fields for 'W/O No.' (000001), 'Description', and a 'Scheduled' button. Below these are tabs for 'Origin', 'Management', 'Work Requests', 'Diagnosis', 'Tasks', 'Man-Hours', 'Materials', 'Other', 'Costs', and 'Documents'. The 'Origin' tab is active, showing fields for 'Item', 'System', 'Work Type', 'Plan. TM (H)', 'C. Centre', 'Performer' (Internal/External), 'Position', and 'Manager'. At the bottom, there are checkboxes for 'Fixed Dates' and 'Fixed Records', a 'Calendar' dropdown, a 'Records' field, and a 'Next MSN' field. Buttons for 'Issue', 'Terminate', 'P.H.', 'OK', 'Cancel', and 'Apply' are at the bottom.

New Work Order – Origin

Identification of the work order main elements. Work Type, Cost Center and Planned Maintenance Time («Plan. TM») fields are mandatory.

The 'New Work Order - Management' window shows a form for managing work orders. It includes fields for 'W/O No.' (000001), 'Description', and a 'Scheduled' button. Below these are tabs for 'Origin', 'Management', 'Work Requests', 'Diagnosis', 'Tasks', 'Man-Hours', 'Materials', 'Other', 'Costs', and 'Documents'. The 'Management' tab is active, showing a 'Work' section with 'W. Req', 'Last', 'Sch. Start', 'Sch. End', 'Issued', 'Start', and 'End' fields. There are also 'Date and Time' and 'Record' sections. On the right, there is a 'Maintenance Times and Down Time' section with 'Compute', 'WT (H)', 'TP (H)', 'TN (H)', 'RT (H)', and 'Down Time' fields. Buttons for 'Issue', 'Terminate', 'P.H.', 'OK', 'Cancel', and 'Apply' are at the bottom.

New Work Order – Management

Identification of the management elements for the work. The different dates are recorded according to the work status.

New Work Order – Work Requests

Displays the work requests which led to the work order (in case of a repair work).

New Work Order – Diagnosis

Allows you to identify the symptom and the cause of the failure for repair works.

New Work Order – Tasks

Describes the work tasks to be done.

New Work Order – Costs

Planned and performed costs comparison chart.

New Work Order – Documents

Allows you to attach documents to the work order.

New MH Record

Record Notes

Cost Document

Cost Doc. Ref.: Cost Document Description:

Cost Doc. Supplier

Man-Hours

Employee: NC - NUNO CASTRO

Date: 11-06-2013 Start: 09:00 End: 18:00 MH Effort: 8.00 Factor: 0 MH Cost: 10.00 Cost: 80.00

Allocation

Material record

Identification of the materials used during work execution. Materials are associated to the work order either by direct application or by store output.

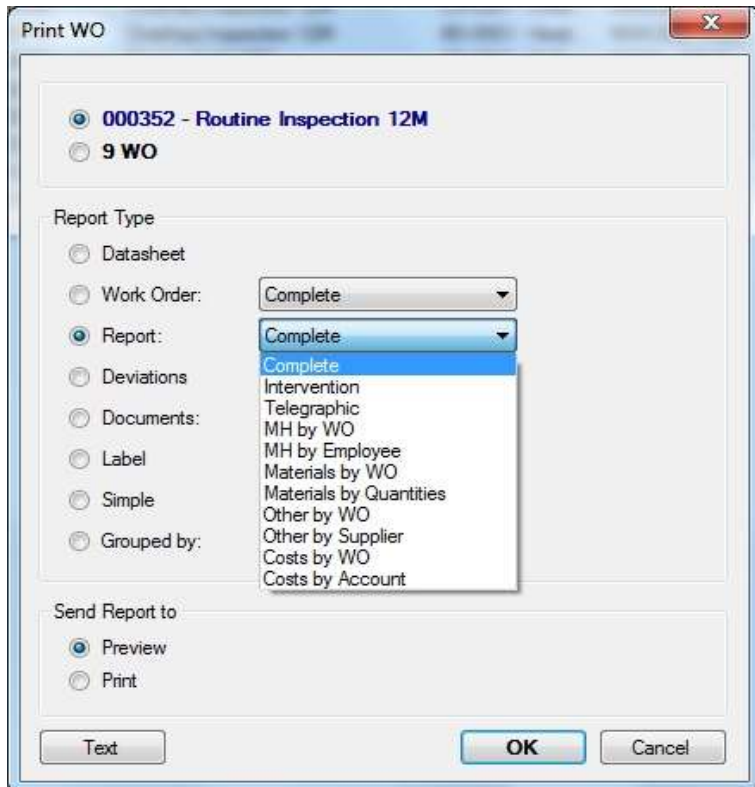

A screenshot of the "New Record" dialog box in the software. It contains several sections: "Cost Document" with fields for "Cost Doc. Ref." and "Cost Document Description", and a "Supplier" button; "Item" with fields for "Item", "Description", "Date" (set to 11-05-2013), "Cost" (0.00), "VAT %" (23.00), and "Total Cost" (0.00); and "Allocation" with fields for "WO" (000073 - ROUTINE INSPECTION 12M), "Item" (PU-0002 - CHILLER N°1 CIRCULATION PUMP CT), "C. Centre" (01.0348 - GOLF PALACE), and "Account". At the bottom are "OK", "Cancel", and "Apply" buttons.

Third party services record (other)
Identification of the third party services contracted to carry out the work.

The contracted services always need to be coordinated with a cost document and should have the indication of the corresponding supplier.

WO Calendar
This feature presents a work preview on a calendar and allows changing the scheduled dates through *drag & drop* resource.

Work order printing

The software has many Planned and Terminated work order printing options.

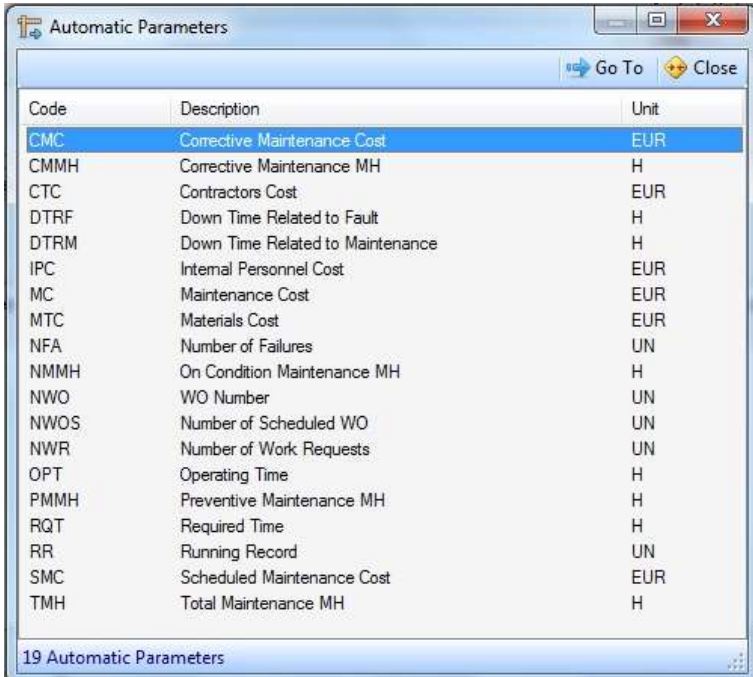

You can print one specific WO or a group of WOs from the list.

Other features from Work Management

- ✎ The systematic works are managed based on a calendar date and/or running records (hours, Kms, cycles, etc.). The system calculates automatically the dates based on the running records e automatically selects whichever date comes first for each work.
- ✎ Every Work Order record, hours spent and used resources, generates automatic parameters which can be directly analyzed or used to create maintenance indicators.

Maintenance Analysis and Indicators

The system calculates a group of automatic parameters in real time for the main software entities: Items, Systems and Cost Centers.

| Code | Description | Unit |
|------|----------------------------------|------|
| CMC | Corrective Maintenance Cost | EUR |
| CMMH | Corrective Maintenance MH | H |
| CTC | Contractors Cost | EUR |
| DTRF | Down Time Related to Fault | H |
| DTRM | Down Time Related to Maintenance | H |
| IPC | Internal Personnel Cost | EUR |
| MC | Maintenance Cost | EUR |
| MTC | Materials Cost | EUR |
| NFA | Number of Failures | UN |
| NMMH | On Condition Maintenance MH | H |
| NWO | WO Number | UN |
| NWOS | Number of Scheduled WO | UN |
| NWR | Number of Work Requests | UN |
| OPT | Operating Time | H |
| PMMH | Preventive Maintenance MH | H |
| RQT | Required Time | H |
| RR | Running Record | UN |
| SMC | Scheduled Maintenance Cost | EUR |
| TMH | Total Maintenance MH | H |

19 Automatic Parameters

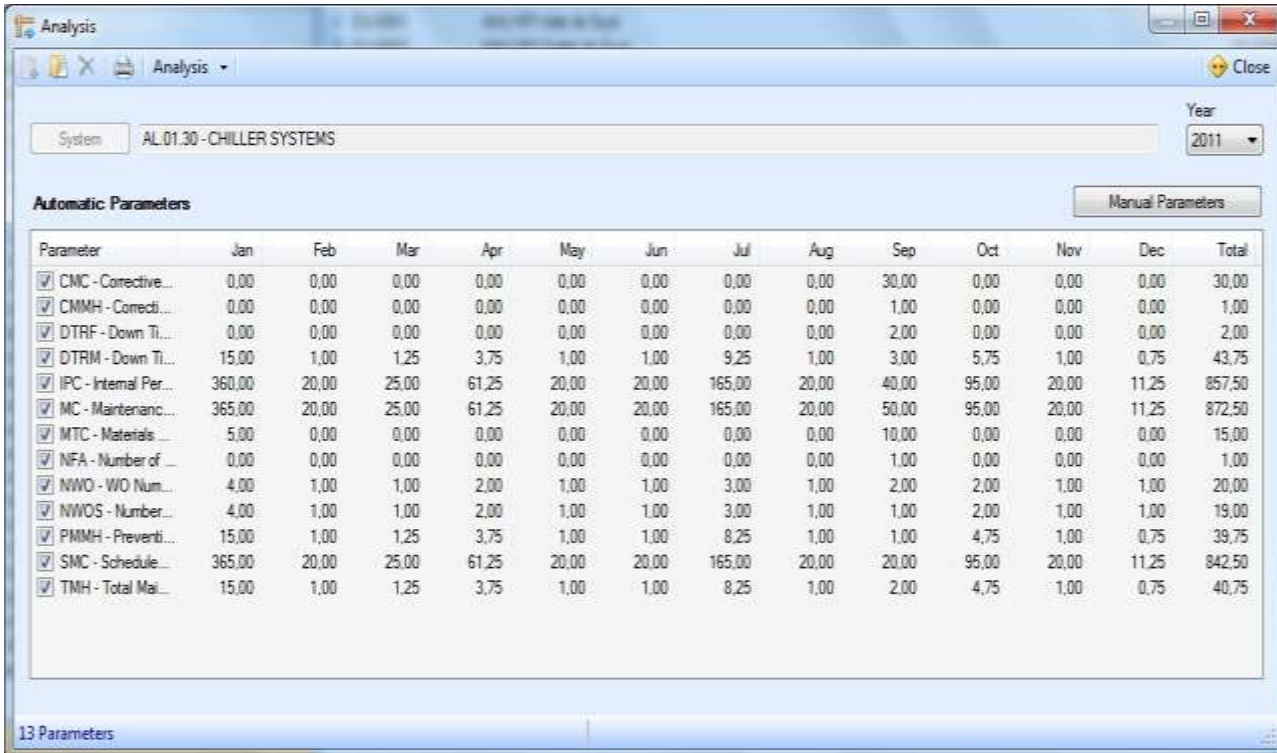

Automatic Parameters

List of automatic parameters available at any time for the present year, last 12 months or the last 5 years.

These parameters are directly available for Items, Systems and Cost Centers or can be used as part of more complex maintenance indicators calculation.

Example:

$MTBF = \text{Operating Time} / \text{Number of Failures}$

| Parameter | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total |

| <input checked="" type="checkbox"/> SMC - Schedule... | 365,00 | 20,00 | 25,00 | 61,25 | 20,00 | 20,00 | 165,00 | 20,00 | 20,00 | 95,00 | 20,00 | 11,25 | 842,50 |
| <input checked="" type="checkbox"/> TMH - Total Mai... | 15,00 | 1,00 | 1,25 | 3,75 | 1,00 | 1,00 | 8,25 | 1,00 | 2,00 | 4,75 | 1,00 | 0,75 | 40,75 |

13 Parameters

Automatic parameters example for a Chiller system. ManWinWin will only show on the list the parameters for which there is at least one record.

The date field on the upper right corner allows you to calculate the parameters for a different year and the checkboxes allow multiple parameter selection in order to build a graph showing the comparison between them.

Example for two automatic parameters comparison.

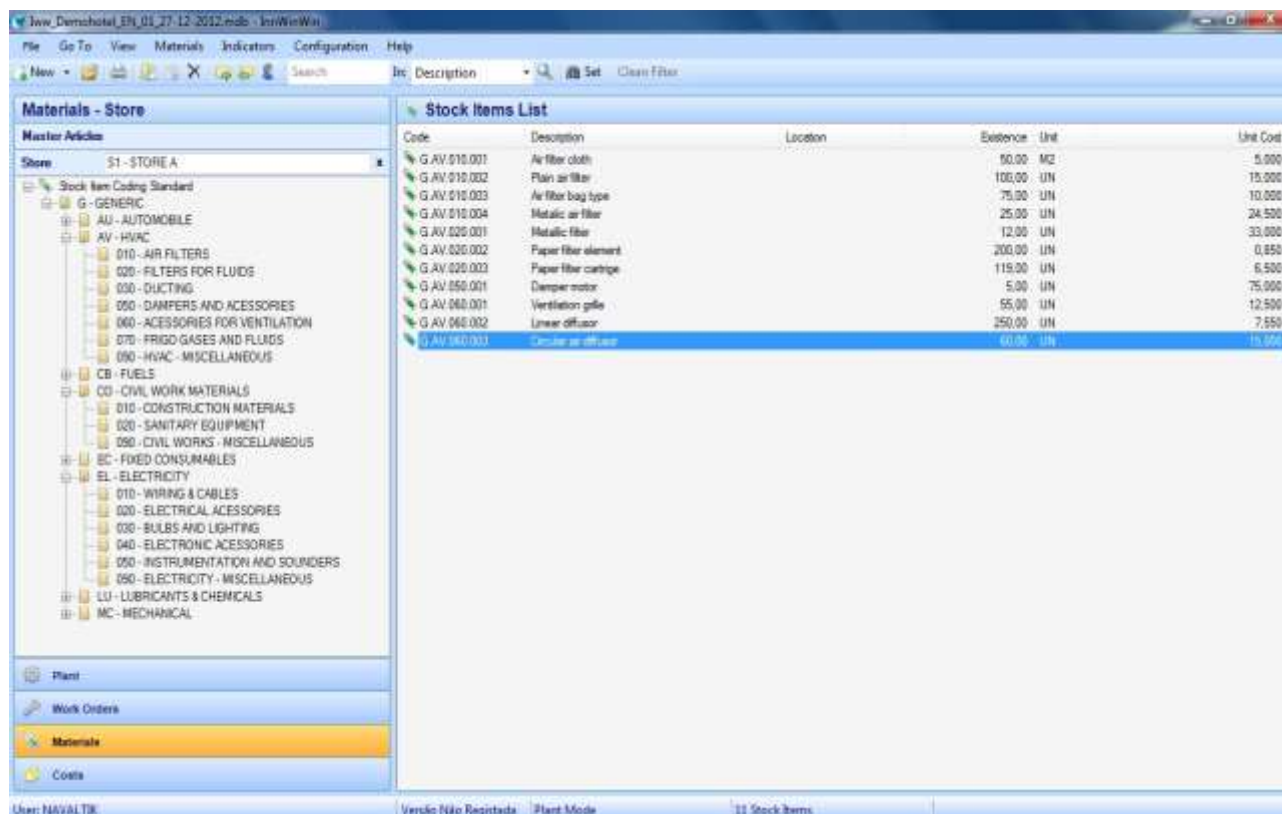

Example for a indicator calculated from automatic parameters.

Other features from Analysis and Indicators

- ✎ The system allows you to define manual parameters which can then be used on indicators calculation formulas. These manual parameters are useful when you want to perform calculations using data which cannot be automatically calculated in the software (example: useful floor area, production volume, sales volume, etc.).

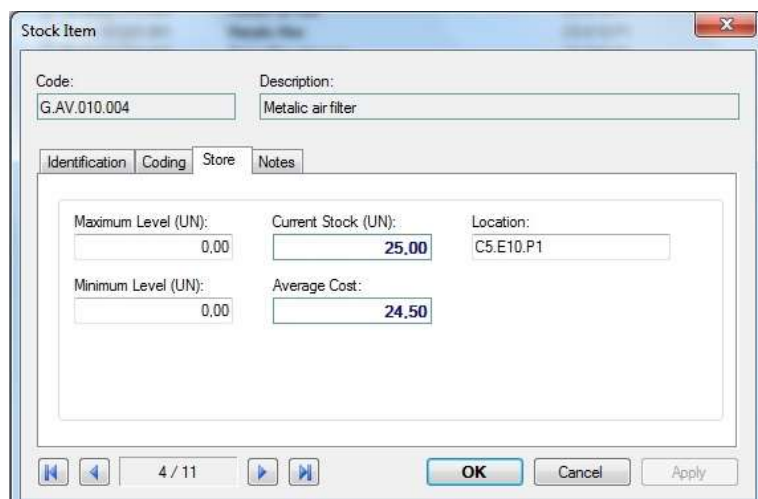

Materials – Store Management

The stock management is an optional module which allows you to manage in an integrated way one or multiple maintenance stores.

Materials management is based on the concept of the Master Articles File where all stock references are recorded. Then the articles may exist in one or more stores with different stock levels and unit costs.

Inside each store the articles are displayed with a label icon which changes its color according to the stock levels.

Stock Item data sheet

It is possible to set maximum and minimum stock levels for each stock item.

It is only possible to record new stock items in the Master Articles.

New Store Entry

Store: S1 - STORE A

Doc. Ref.: F - 12345/01 Date and Time: 11-06-2013 10:00 Ref. 01: Ref. 02:

Description: HVAC Filters

Supplier: 00321 - GBLD

Amount: 245.00 VAT Amount: 56.35 TOTAL: 301.35

Stock Items

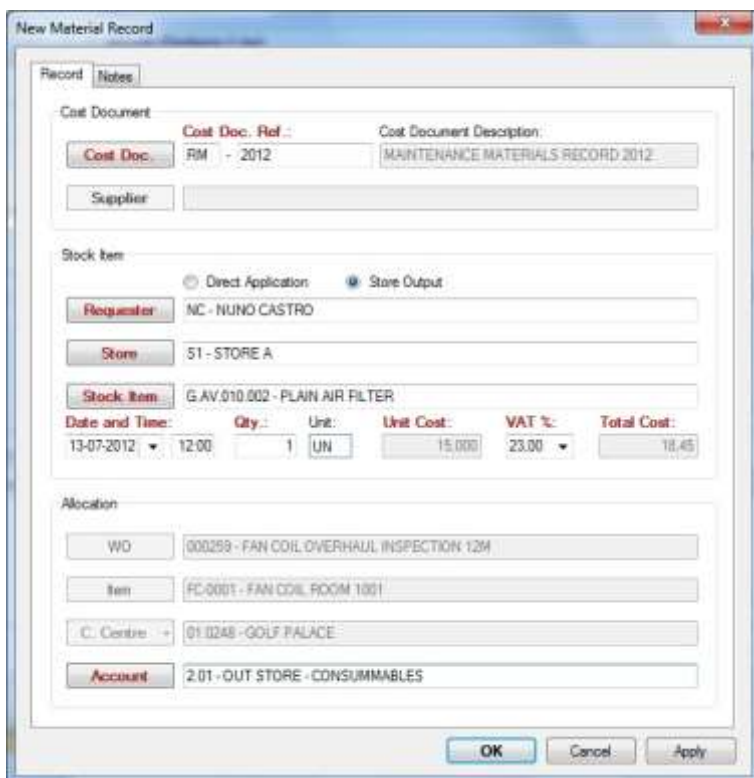

| Item | Code | Description | Qty | Unit | Unit Cost | Total Cost |
|------|--------------|--------------------|-------|------|-----------|------------|
| 01 | G-AV-010-004 | Metalic air filter | 10.00 | UN | 24.500 | 245.00 |

OK Cancel Apply

New store entry

The store entry is made by an invoice, transport document or another type of document and needs some mandatory information.

The store entry can be made without consolidation thus allowing any changes or corrections. After the store entry consolidation the system calculates stock levels and unit costs for the corresponding stock items and the store entry becomes locked.

New Material Record

Record Notes

Cost Document

Cost Doc. Ref.: RM - 2012 Cost Document Description: MAINTENANCE MATERIALS RECORD 2012

Supplier:

Stock Item

☐ Direct Application ☒ Store Output

Requester: MC - NUNO CASTRO

Store: S1 - STORE A

Stock Item: G-AV-010-002 - PLAIN AIR FILTER

Date and Time: 13-07-2012 12:00 Qty.: 1 Unit: UN Unit Cost: 15.000 VAT %: 23.00 Total Cost: 18.45

Allocation

Inventory

The software allows you to perform partial or complete inventories, with item count recording features that enhance your productivity.

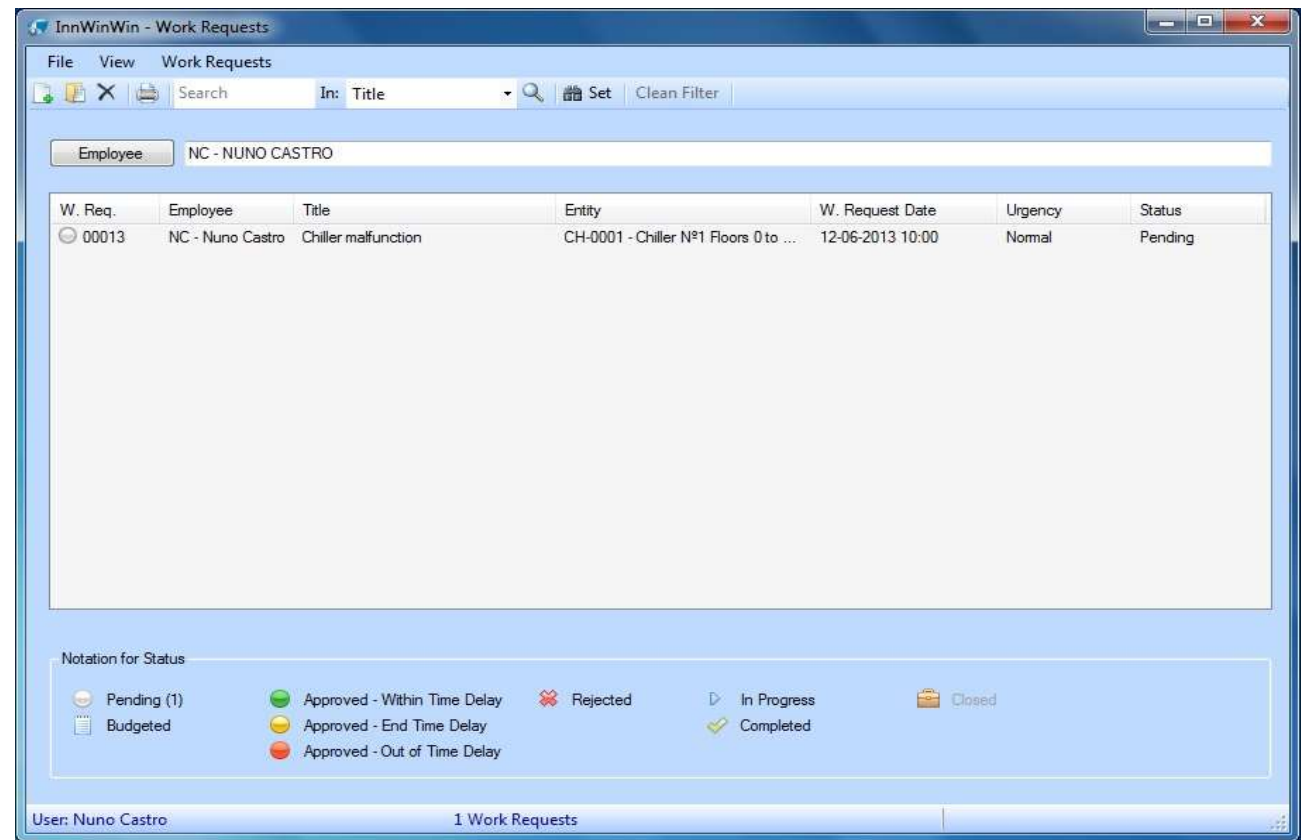

Other features from Store Management

- Supplier return to correct store entries and store return to correct store outputs.
- Transfers between stores to make stock item movement quicker and easier.
- Store entries produce, automatically, relationships between stock items and their suppliers.
- The system keeps a continuous stock item movement history which can be directly consulted.
- It is possible to easily and directly consult the stock level for every stock item in all stores.

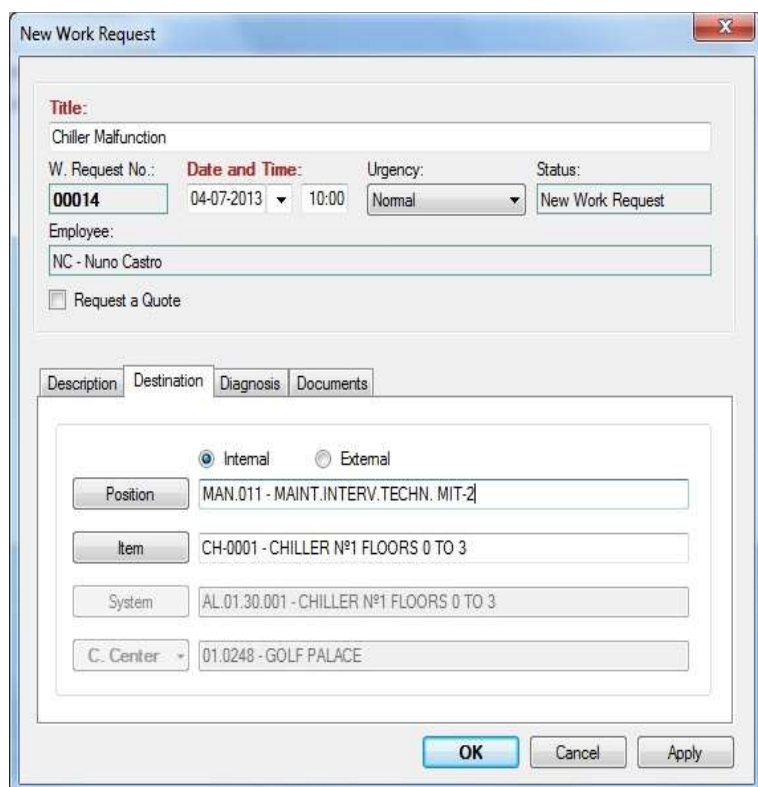

Work Requests

The work requests module runs autonomously from the main ManWinWin application.

The work requests window shows the work request list together with icons which demonstrate the current status of each request.

New Work Request

Title:
Chiller Malfunction

W. Request No.: **00014** **Date and Time:** 04-07-2013 10:00 **Urgency:** Normal **Status:** New Work Request

Employee:
NC - Nuno Castro

☐ Request a Quote

Description **Destination** **Diagnosis** **Documents**

☒ Internal ☐ External

Position: MAN.011 - MAINT.INTERV.TECHN. MIT-2

Item: CH-0001 - CHILLER Nº1 FLOORS 0 TO 3

System: AL.01.30.001 - CHILLER Nº1 FLOORS 0 TO 3

C. Center: 01.0248 - GOLF PALACE

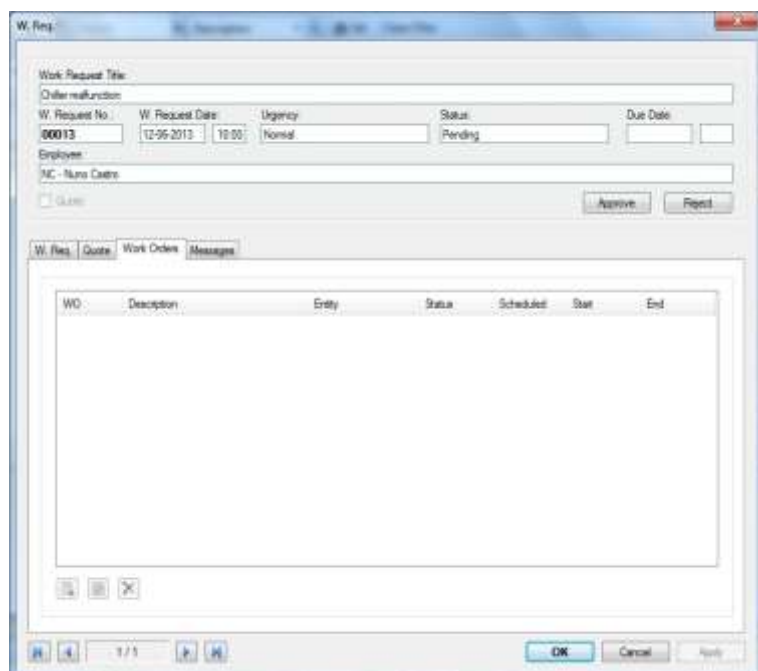

OK **Cancel** **Apply**

Work request

This feature allows you to record maintenance requests in a simple way. The mandatory fields are the title, the date and item related information or at least the cost center.

The first status of a new request is always "Pending".

You may always "Request a Quote" together with the maintenance request. In this case, the work request cycle will be a little different than usual.

W. Req.

Work Request Title:
Chiller malfunction

W. Request No.: **00013** W. Request Date: 12-06-2013 10:00 **Urgency:** Normal **Status:** Pending **Due Date:**

Maintenance requests management

Requests are managed inside the main ManWinWin application.

Pending requests can either be approved or rejected. If a request requires a quote, instead of approved they are first quoted.

The approval of quoted requests is made by the requester, this means it is his responsibility to approve or reject the quotation.

Approved requests acquire the "In Progress" status when they have at least one open Work Order; and become "Completed" status when all corresponding open WOs are terminated.
